

Integrating Video Clips into the “Legacy Content” of the K–12 Curriculum: TV, Movies, and YouTube in the Classroom

Ronald A. Berk

Disclaimer: *This chapter is based on a presentation given at the annual Evaluation Systems Conference in Chicago. Since the content of the October 2008 presentation focused on using videos in the classrooms of the future, this chapter will not be able to capture the flavor and spirit of the actual videos shown. The audience exhibited a range of emotions, from laughter to weeping to laughter to weeping. Unfortunately, this print version will probably only bring about the weeping. Keep a box of tissues nearby. Enjoy.*

Using videos in teaching is not new. They date back to prehistoric times, when cave instructors used 16 mm projectors to show cave students examples of insurance company marketing commercials in business courses. Now even DVD players are history. So what's new? There are changes in four areas: (1) the variety of video formats, (2) the ease with which the technology can facilitate their application in the classroom, (3) the number of video techniques a teacher can use, and (4) the research on multimedia learning that provides the theoretical and empirical support for their use as an effective teaching tool. A PC or Mac and a LCD projector with speakers can easily embed video clips for a PowerPoint presentation on virtually any topic.

This chapter examines what we know and don't know about videos and learning. It begins with detailed reviews of the theory and research on videos and the brain and multimedia learning. These reviews provide the springboard for proposing specific learning outcomes and ten generic techniques to integrate video clips into multimedia teaching across the K–12 curriculum. This chapter is divided into five sections: (1) why use videos in teaching? (2) technology tools in the classroom, (3) selecting appropriate videos, (4) ten generic techniques for using video clips in teaching, and (5) conclusions.

Dr. Ronald A. Berk is Professor Emeritus of Biostatistics and Measurement at The Johns Hopkins University.

Why Use Videos in Teaching?

When you watch a movie or TV program, superficial and even deep feelings and emotions are elicited, such as excitement, anger, laughter, relaxation, love, whimsy, and even boredom. These emotions are often triggered or heightened by the mood created by specific visual scenes, the actors, or the background music. A video can have a strong effect on your mind and senses. It is so powerful that you may download it off the Internet or order the DVD from Amazon along with the CD soundtrack so that you can relive the entire experience over and over again. This attraction to videos extends to movies, TV programs, commercials, and music videos. So how can teachers in all subject areas use video clips as an instructional tool so that their students can experience the powerful cognitive and emotional impact that they can provide?

Learning Outcomes

What is the learning value of video clips in the classroom? Here are twenty potential outcomes to ponder:

1. Grab students' attention
2. Focus students' concentration
3. Generate interest in class
4. Create a sense of anticipation
5. Energize or relax students for a learning exercise
6. Draw on students' imagination
7. Improve attitudes toward content and learning
8. Build a connection with other students and the instructor
9. Increase memory of content
10. Increase understanding
11. Foster creativity
12. Stimulate the flow of ideas
13. Foster deeper learning
14. Provide an opportunity for freedom of expression
15. Serve as a vehicle for collaboration
16. Inspire and motivate students

17. Make learning fun
18. Set an appropriate mood or tone
19. Decrease anxiety and tension about scary topics
20. Create memorable visual images

After you have finished pondering, consider the theoretical and research evidence related to these outcomes, which is reviewed in the next two sections on videos and the brain and videos and multimedia learning.

Videos and the Brain

There are hundreds of volumes on the topic of the brain. However, the primary interest here is only on how a video is processed in students' brains to facilitate learning. This review covers (1) core intelligences of verbal/linguistic, visual/spatial, musical/rhythmic, and emotional; (2) left and right hemispheres; (3) triune brain; (4) brain wave frequencies; and (5) video-brain conclusions.

Core intelligences. Among Gardner's 8.5 multiple intelligences (Gardner 1983, 1993, 1999, 2005; Gardner and Hatch 1989; Kagan and Kagan 1998; Marks-Tarlow 1995; Williams et al. 1996), verbal/linguistic, visual/spatial, and musical/rhythmic are core intelligences in every student's brain. Here are brief descriptions:

Verbal/linguistic: Learn by reading, writing, speaking, listening, debating, discussing, and playing word games

Visual/spatial: Learn by seeing, imagining, drawing, sculpting, painting, decorating, designing graphics and architecture, coordinating color, and creating mental pictures

Musical/rhythmic: Learn by singing, humming, listening to music, composing, keeping time, performing, and recognizing rhythm

These three intelligences are part of that unique profile of strong and weak intelligences that every student possesses. Neuroscience research has confirmed the physical difference in the neuronal networks of each student's brain (Zull 2002). Teachers can only work with what each student brings to the classroom.

This "pluralistic view of the mind" permits teachers to think of exposing their students to a wide range of learning strategies. Drawing on from four to six intelligences allows virtually every student to use their strength intelligences as well as strengthen their weaker ones. Videos can tap verbal/linguistic and visual/spatial, and even musical/rhythmic (Gardner 2000; Veenema and Gardner 1996).

Goleman's (1998) emotional intelligence is also tied to videos. (*Note:* Gardner's intrapersonal and interpersonal intelligences are similar to Goleman's emotional intelligence.) *Intrapersonal* involves self-reflection, self-direction, self-motivation, controlling impulses, planning, independent study, and metacognition; *interpersonal* emphasizes relating, cooperating, empathizing, teaching, leading, connecting with others, resolving conflicts, and engaging in social activities. The music alone in videos can elicit emotional reactions of liking or disliking and excitement or arousal (North and Hargreaves 1997; Robazza, Macaluso, and D'Urso 1994). Video clips can be used to communicate with learners at a deeper level of understanding by touching their emotions.

Left and right hemispheres. There are separate hemispheres of the brain that relate to two ways of thinking: verbal and nonverbal (Gazzaniga 1992; Sperry 1973). The left hemisphere is predominately the logical and analytical side, which processes information sequentially, as in mathematics, logic, and language. It is also the verbal side, which is structured, factual, controlled, rational, organized, planned, and objective (Miller 1997). In contrast, the right hemisphere is the nonverbal, creative side, which is spontaneous, emotional, disorganized, experimental, empathetic, subjective, intuitive, and seeking relationships. It focuses on art, color, pictures, and music (Jourdain 1997; Polk and Kertesz 1993).

A video clip engages both hemispheres. The left side processes the dialogue, plot, rhythm, and lyrics; the right side processes the visual images, relationships, sound effects, melodies, and harmonic relationships (Hébert and Peretz 1997; Schlaug et al. 1995).

Triune brain. A cross-section of the brain would reveal that it has three layers: (1) the stem, or *reptilian* brain (5%), which performs basic tasks, such as breathing, pulse, and heart rate, and also determines the nature of sound: its direction, volume, and potential threat; (2) the inner layer, or limbic brain (10%), which is the center of our emotions and reacts to videos with appropriate emotions and long-term memory; and (3) the outer-layer wrapper, or "bark," called the neocortex, or cerebral cortex brain (85%), which controls hearing, vision, language, and higher-level functioning and responds to the video clip intellectually (MacLean 1990). The latter "thinking brain" absorbs the sounds of the reptilian brain and the feelings of the limbic system and organizes them into a video production. This triune concept facilitates our understanding and creation of video clips.

Brain wave frequencies. Another aspect of brain functioning is brain wave frequencies. Among the four types of waves—delta, theta, alpha, and beta—that relate to various levels of consciousness, the alpha and beta waves have particular implications for videos. Delta deep sleep or theta shallow sleep—a state of deep contemplation and free-flowing creativity—may be characteristic of students in classes where the instructor only lectures. Alpha waves occur when students are in a relaxed state of awareness, such as after they wake up in class. The right hemisphere is primarily engaged in alpha when students are reading, studying, or reflecting. In this state, the emotions are dominant, and the left hemisphere’s rationality drops out of sight temporarily. Slow, reflective, thought-provoking video clips foster alpha waves. Thus, the brain becomes relaxed, which can be useful when reviewing content so that it passes into long-term memory (Millbower 2000).

Beta waves are the patterns of a fully awake mind, when the left hemisphere kicks into action. This is multitasking mode for the Net Generation of students. They are functioning at optimum speed. Fast action, Jackie Chan-*Rush Hour*, *Mission: Impossible*-type video clips can snap students to attention who are in a drifting alpha or meditative theta state, leaving them super-alert and ready for whatever activities the instructor has planned.

Video-brain conclusions. The value of a video clip as a teaching tool lies in its potential to do the following: (1) tap the core intelligences of verbal/linguistic, visual/spatial, musical/rhythmic, and emotional interpersonal and intrapersonal; (2) engage both the left and the right hemispheres; (3) appeal to the reptilian, limbic, and neocortex layers of the brain to sense the nature of sounds, react to scenes and music emotionally, and appreciate all of it intellectually; and (4) manipulate students’ alpha and beta brain waves to relax or alert them for learning when they’re not sleeping in delta- or theta-wave land. It would be a shame not to stir up these intelligences, hemispheres, layers, and waves in the classroom to promote learning. For an opposing perspective on the inadequacy of the preceding cognitive neuroscientific findings and their implications for educational practice, see Waterhouse’s critical review of the evidence (2006a, 2006b).

Videos and Multimedia Learning

Several theories of learning have examined the dual coding of verbal communication, including visual, auditory, and articulatory codes, and nonverbal communication, which may include shapes, sounds, kinesthetic actions, and emotions. The theories have been linked to multimedia, and the research has tested various classroom applications. This section briefly summarizes pertinent findings for the use of videos.

Multimedia learning theory. Over the past decade, a corpus of studies has accumulated investigating the effects of multimedia strategies on learning. *Multimedia* typically refers to the presentation of material in two forms: auditory/verbal and visual/pictorial (Mayer 2001). The strategies have included reading programs (Chambers et al. 2006), multimedia stories (Verhallen, Bus, and deJon, 2006), and mathematics games (Moreno and Durán 2004), in addition to auditory and video media.

Mayer's cognitive theory of learning is activated through five steps: "(a) selecting relevant words for processing in verbal working memory, (b) selecting relevant images for processing in visual working memory, (c) organizing selected words into a verbal mental model, (d) organizing selected images into a visual mental model, and (e) integrating verbal and visual representations as well as prior knowledge" (2001, 54). His theory represents an amalgam of Sweller's *cognitive load theory* (1999; Chandler and Sweller 1991), Baddeley's *working memory model* (1999), and Paivio's *dual-coding theory* (1986; Clark and Paivio 1991).

The results of Mayer's research indicate that the contiguous presentation of verbal and visual material, as in videos with integrated dialogue or narration, is most effective for novices and visual learners. That is, the use of meaningful video clips in teaching may be most appropriate for introductory or basic material, lower-achieving students, and visual/spatial learners. Certainly, all other topics and students may benefit as well.

Content applications. The empirical findings of research on the effectiveness of videos embedded in multimedia classes or modules are very encouraging. Numerous studies in specific areas such as teacher education have produced significant results favoring videos (Borko et al. 2008; Brophy 2004; LeFevre 2003; Moreno and Valdez 2007; Pryor and Bitter 2008; Richardson and Kile 1999; Seago 2003; Sherin 2003; Wang and Hartley 2003).

However, research with K–12 student samples is sparse. A sprinkling of applications has appeared in ten areas: short stories (Meringoff 1980; Stoneman and Brody 1983), health intervention (Eakin et al. 1998), interpersonal communication (Proctor and Adler 1991), leadership (Rosser 2007), visual literacy (Teasley and Wilder 1994), critical thinking (Leland 1994; Payne 1993), writing (Leland 1994), second-language learning (Chapple and Curtis 2000; Liu 2005; Plass et al. 1998; Salaberry 2001), active learning (Greg et al. 1995), and multicultural diversity and sensitivity training (Pintertis and Atkinson 1998; Tyler and Guth 1999). A few of the earlier studies compared TV versus radio (Barrow and Westley 1959; Beagles-Roos and Gat 1983).

Conclusions. These studies furnish descriptive or experimental evidence of the effectiveness of the video applications. Overall, most of the investigations support the dual-coding theory that more is better: multimedia auditory/verbal and visual/pictorial stimuli increase memory, comprehension, understanding, and deeper learning than either stimulus by itself. Learning in the pictorial conditions tested (video and audiovisual) was superior to learning in the verbal (audio) conditions. This is consistent with the picture superiority effect (Nelson, Reed, and Walling 1976; Paivio, Rogers, and Smythe 1968).

Technology Tools in the Classroom

Our culture has been flooded with burgeoning technology. It is almost impossible to keep up with all of the amazing products that are hitting the streets. Among all of the tools currently available, which ones do students use, and which ones have potential for classroom use? The answers to those questions are examined in the following two sections: (1) tools of the trade for students, and (2) tools for the classroom. Of course, by the time this chapter has been published, the information in those sections will be out of date. In fact, it's probably a good idea to rip out these pages right now. That's just the nature of the technology beast.

Tools of the Trade for Students

Today's Net Generation of students is so sophisticated with technology that they have been branded digital natives (Prensky 2001, 2006). "Digital" is their native language. They are native speakers of the language of computers, video games, and the Internet. As you observe these students, you will notice wires coming out of every part of their anatomy. Attached to those wires are MP3 players, iPods, iPhones or smart phones, PCs, and all the other tools of the digital age (Berk 2008a, 2008b; Berk and Trieber, in press). The teachers are the ones without the wires. That brings us to our first multiple-choice question:

What are they doing with all of this equipment?

- A. Listening to music
- B. Playing PC/video games
- C. Talking on the phone
- D. Sending text messages (TMs) or Twittering
- E. Watching videos and/or TV

F. Multitasking on at least three of the above

G. Multitasking on all of the above

Recent estimates indicate that these students spend from 6.5 to 11 hours per day multitasking on the above activities (Jenkins 2006). They live in a complicated, remixed, mashed-up, digital, mobile, always-on media environment (Oblinger and Oblinger 2006). The students function at “twitch speed,” thanks to their exposure to video games and MTV. They listen to music on their PCs, Macs, iPods, Zunes, Zens, iPhones, RAZRs, and BlackBerrys. Their experience with the technology has enabled them to master complex tasks and make decisions rapidly (Prensky 2006). Classroom exercises need to extend these capabilities, which they already possess.

In contrast to these digital natives, teachers are referred to as *digital immigrants*. They still have one foot in the past, and “digital” is their second language, as they continue to learn and sometimes struggle with it on the fly. For example, immigrants may still print out an e-mail, print a document to edit it, or phone someone to see if he or she received their e-mail. Do you know any colleagues like that?

Tools for the Classroom

For small-group or class-size activities, videos can be played on a DVD player or video clips can be inserted into PowerPoint slides on a PC or Mac with audio output from the sound system in the room. There are a variety of configurations. If a teacher runs into difficulty, an IT staff member or one of his or her students should be able to assist and find a way to play the video.

Selecting Appropriate Videos

Choosing videos for classroom use involves several issues. This section provides guidelines for teachers in the following forms: (1) criteria for selection, (2) types of videos, and (3) sources for selecting videos. After this section, it will finally be time to consider ten techniques for embedding video clips into teaching.

Criteria for Selection

A video is rated from “G” for general audiences with no restrictions to “NR,” in which no one except rodents is allowed to watch it because it’s so evil. More important are the content ratings for graphic violence, obscene language, nudity, sexuality, and gore. Commercial movies and music videos are out of control. Anything and everything are used to attract audiences. If a video

clip or an entire movie is going to be used as a teaching tool, criteria must be established for what is appropriate and acceptable in a teaching-learning context. Each teacher should set his or her own standards for videos, just as standards may have already been set for other types of classroom behaviors, such as offensive humor (Berk 2002, 2003, 2009), inappropriate or disparaging comments, and issues of civility.

There are three sets of criteria that must be considered: (1) the students' characteristics, (2) the offensiveness of the video, and (3) the video structure. The first set of criteria relates to salient *sociodemographic characteristics*: age or grade level, gender, ethnicity, and language-dominance. Teachers know their students, and these characteristics are a must consideration in choosing the right video.

The second set of criteria concerns the possible *offensiveness of the video* according to the categories mentioned previously, plus content *irrelevant* to the reason for showing the video, such as put-downs or ridicule of females, racial and ethnic groups, professions, politicians, and celebrities; mental or physical abuse of anyone; drug use; and other offensive content. Clear standards for "acceptable" content should be delineated.

The video is being used to facilitate learning, not impede it. A student who is offended by a video clip will withdraw, turn off, and harbor anger, which are emotions hardly conducive to learning. What is interpreted as offensive is a very personal decision by each student based on his or her own values, beliefs, and principles. The teacher should make every effort to reject any material that is even borderline or potentially offensive. The pool of available videos is large enough that picking the right stuff should not be a problem. If it is a problem, the teacher should seek counsel from colleagues who would be sensitive to such issues. (*Note*: There are exceptions to this offensiveness rule, such as when really offensive content may be part of the information or message to be gained from watching the video. Students should be cautioned in those cases so that they are emotionally prepared.)

Finally, the *structure of the video* must be appropriate for instructional use. The following guidelines are suggested when creating video clips: (1) length—as short as possible to make the point; edit unmercifully to a maximum of three minutes unless the learning outcome requires a lengthier extract; (2) context—authentic, everyday language use unless purpose relates to language; (3) actions/visual cues—action should relate directly to purpose; eliminate anything extraneous; and (4) number of characters—limit number to only those few needed to make the point; too many can be confusing or distracting.

Types of Videos

There is a wide range of video categories that can be used in the classroom. The actual choice will depend on the instructional purpose or outcome and the characteristics of the students and their interests. The sources identified in the next section will suggest methods for obtaining that information. In the mean time, here is a shopping list to keep in mind: (1) drama, (2) action, (3) romantic, (4) comedy, (5) romantic comedy, (6) documentary, (7) TV programs, (8) commercials, (9) music videos, and (10) teacher- or student-made videos.

All of these types of videos can evoke or induce anger, excitement, terror, activity, motivation, love, laughter, whimsy, tears, dreams, calmness, relaxation, sleep, and a coma. Videos can have powerful emotional effects. Teachers need to decide the effect they want to produce in a given learning situation. Applied inappropriately, the video clip can distract and decrease learning, even incite students to riot. Unless rioting is a specific learning outcome, teachers should be very discerning in their choices.

Sources for Selecting Videos

Videos selected for grade level, subject matter, and various courses are not the same as videos chosen for courses in film, video, and TV production; nonfiction and experimental cinema; digital media studies; and similar courses in film. The purposes are very different. Videos for the former consist of clips with which most if not all students in the class should be familiar; in the case of the latter, the intent is usually to study, produce, and critique videos with which they may be familiar or unfamiliar. The sections that follow cover published sources and Web sites, identification of videos in the students' world, a formal student survey, and technical sources for videos.

Published sources and Web sites. Over the past decade, major works are limited to *English* and *sports and recreation*. Golden (2001) examined the links between thirty movies and literary study and textual analysis, which are intended for high schoolers. O'Bannon and Goldenberg (2008) used seventy-seven pop culture and documentary movies, categorized by topic and theme, to cover nineteen core topics in recreation, sports, tourism, and physical education, such as environmental issues, diversity, and commercial recreation. The authors provide guidance on framing methods, discussion and reflection questions, and debriefing activities to engage students.

Web sites that contain hundreds of movies for teaching with lesson plans, learning guides, and indices by subject matter or theme (social-emotional or moral-ethical issues) include <http://www.teachwithmovies.com> and http://www.geocities.com/sportsmovies/SPMD_Theme_Index.htm

Identification of videos in the students' world. The primary underpinning for the video techniques that follow is to *pick videos the students recognize*, with which they are familiar, and in which they have an interest. Therein lies the connection between their world and the content teachers need to cover. Where does one find videos in the students' world? The answer to that question leads us to our second multiple-choice item:

What is the most appropriate source from which to select videos for class?

- A. *TV programs* based on Nielsen Media Research survey results for the various age categories
- B. *Movies* based on cult classics, Oscar winners, and most recent and popular flicks
- C. *YouTube videos* that are top-rated or most often viewed
- D. *Music videos* targeted for the high school market
- E. Informal and formal student surveys of what videos students watch
- F. All of the above

A formal student survey. Let's chat about choice E for a few sentences. This choice means teachers should ask their students. Teachers should talk to them at every opportunity to find out the latest and most popular videos they are watching. Further, teachers should conduct a formal survey of their students at the beginning of their first class of the semester or prior to that class online. This survey, which can be completed in less than ten minutes, will furnish a wealth of video information. Here are eight steps to follow:

1. Pass out two 3 x 5 cards to each student
2. Ask students to number each side of each card in the upper right corner with 1, 2, 3, and 4
3. On side 1, have them list their *3 favorite TV programs*
4. On side 2, have them list their *3 favorite movies* seen over the past 3–6 months
5. On side 3, have them list their *3 favorite commercials*

6. On side 4, have them list their *3 favorite music videos*
7. Ask students to pass the 1-2 card to the right and the 3-4 card to the left
8. Collect all of the cards (they will be all mixed up in the wrong piles)

Now the teacher can collate, compile, categorize, compute, and identify the videos their students are watching. He or she should take side one and create a frequency distribution of the top ten TV programs the students are watching. A distribution should then be computed for each of the other three sides. Those distributions will yield four top-ten lists that can serve as the pool of videos from which clips can be extracted for the entire course. That's forty different videos. Those videos should be used in conjunction with those the teacher chose to pick for particular outcomes. That composite list is probably the *most accurate inventory of video selections* a teacher can use.

Technical sources for videos. There are three principal sources from which to obtain the videos: original DVDs, the Internet, books with CD clips. There are several factors to consider in using these sources. If the video segment needs to be extracted and converted to a format compatible with Microsoft PowerPoint (PP) for PCs, the Internet may already have the converted version; otherwise, the teacher will have to do the extracting and conversion with specific software, such as Sony Vegas Movie Studio Platinum Version 7 or 8, DVD Shrink 3.2, or Cucusoft Pro Version 7.07, unless he or she has a Mac. Extract only the clip from the video that you need to make your point. Other factors include the following:

Factor	DVD	Internet	Books with CD Clips
<i>Cost</i>	Expensive	Free or cheap	Cheap
<i>Quality</i>	High	Good—High	High
<i>Format</i>	Not PP compatible	Some PP compatible	Some PP compatible
<i>Convenience</i>	Moderate	Moderate—High	High
<i>Most recent availability</i>	Very good	Very good	Very good

Ten Generic Techniques for Using Video Clips in Teaching

Based on the literature review above, the most common procedure for using a video clip in teaching consists of the following steps:

1. *Pick a particular clip* to provide the content or illustrate a concept or principle. (Note: If you want students to view the entire movie, assign that viewing outside of class.)
2. *Prepare specific guidelines* or discussion questions so students have direction on what to see, hear, and look for. What's the point of the clip? Make it clear to students.
3. *Introduce the video* briefly to reinforce purpose.
4. *Play the clip.*
5. *Stop the clip* at any scene to highlight a point, or *replay the clip* for a specific in-class exercise.
6. *Set a time for reflection* on what was seen.
7. *Assign an active learning activity* for the class to interact on specific questions, issues, or concepts in the clip.
8. *Structure a discussion* around those questions in a small- or large-group format.

These eight steps are the basic elements in most content applications.

You can use video clips in that mold or broaden your applications far beyond those steps. Seriously consider your students' survey results on TV programs, movies, commercials, and music videos. That forty-video pool should be your first choice. Then go to other sources. Don't think only about movies. There are loads of TV programs on DVD to which students can relate.

Here are ten generic techniques with high school examples you might consider:

1. *Provide Content and Information*

This technique is the one that appears most frequently in the literature cited previously. The eight-step procedure above can be applied to any course content. The types of videos may range from National Geographic documentaries on specific animals, people, or regions to *Saving Private Ryan* (invasion of Normandy) to *Schindler's List* (holocaust) to *Rent* (Bohemian lifestyle) to *Columbo* or *Monk* (elements of a mystery). The list is endless. Although the specific

clip may be used anywhere within the coverage of the material, the timing of the clip should be appropriate to the context.

2. *Illustrate a Concept or Principle*

Instead of providing content, the clip can also be played to illustrate a concept already presented. For example, characteristics and descriptions of the following concepts can be seen in clips from the accompanying videos: family relationships (*Cheaper by the Dozen*, *Father of the Bride*, *Meet the Parents*, *Home Alone*, *Full House*, *The Cosby Show*, *Home Improvement*), anger management (*Anger Management*), race relations (*A Girl Like Me*; *This Is Being Black*, *This Is Being White*; *Bill Cosby Breaks It Down*), and self-esteem/media standards of beauty (Dove commercials; *Onslaught* and *Evolution* on YouTube).

3. *Present Alternative Viewpoints*

In political science, history, international relations, and journalism high school courses, debate procedure, format, strategies, and arguments can be analyzed by viewing actual debates between political candidates, especially presidential. Comparing clips from the original Kennedy-Nixon debates with those of more recent candidates can be extremely informative. Arguments by plaintiffs and defendants in a real courtroom setting can also be analyzed, with a student or class decision reached prior to the actual decision by Judge Judy, Joe Brown, Alex, Hatchett, or Cristina.

Even clips from TV courtroom scenes or movies can convey powerful arguments. TV series such as *Boston Legal*, *Law & Order*, and *Shark*, and classics such as *Perry Mason*, *Matlock*, and *L. A. Law* can furnish lots of examples. The movie *The Great Debaters*, a David and Goliath tale, was played to maximum effect with a rousing and stunner of an ending in which debaters James Farmer Jr. and Samantha Booke from tiny black Wiley College in Marshall, Texas, out-argue the white national debate champion team from none other than Harvard in 1935 on the topic of civil disobedience.

4. *Apply the Content to Real-World Applications*

Students want real-world applications to see the relevance of what they are learning. Videos can furnish very graphic, explicit examples of a wide range of content. They are particularly apropos for volatile, contentious, and negative behaviors, such as legal issues related to child and spousal abuse, rape, and pedophilia (*Law & Order*:

SVU); racial slurs and degradation (*Crash*, *Soul Man*, and *The Great Debaters*); childbirth (documentary vs. *The Cosby Show* or *Father of the Bride II*); covert CIA foreign operations in Afghanistan (*Charlie Wilson's War*); and incivility and harassment in the workplace (*The West Wing*). The visual depiction of a specific behavior or event can be a powerful addition to the verbal or quantitative explanation.

5. *Serve as a Stimulus for Learning Activities*

Suppose you began class by darkening the room to total blackout. After a few anxious moments, as students are trying to anticipate what is happening, you play a short and, maybe, provocative video clip. It may relate to the previous class material or serve as the fireball stimulus package for a new topic. Consider the impact. What do you do when the lights come up? Your students' attention and interest are now in the palm of your hand.

You have several options: (a) ask students for their immediate reactions in an open discussion; (b) direct a small-group collaborative learning activity, with specific questions to answer; (c) ask pivotal questions about the clip to introduce the topic; (d) request students to write a minute response; or (e) engage students in a think-pair-share, with or without a leading question. You could probably think of other learning opportunities that can be generated from the clip.

This technique can be used to open class, after a class break, or at any other time to segue to a summary or review of content or to introduce a new topic. There are so many real-life situations that can be used to stimulate individual and small- and large-group activities or even incite your students to riot in the classroom. One of the most obvious content areas is political science. For example, political interviews and commentary by pundits on *The Daily Show with Jon Stewart*, *The Colbert Report*, and real news programs (commercial and cable) can do the trick. If they don't work, try a YouTube video, a JibJab parody, or an excerpt from a reality or surreal-world show.

6. *Provide a Good or Bad Application to Critique*

One of the best techniques to generate student interest and hone critical-thinking skills is to present a video clip of a Hollywood interpretation of a real-world application. They're rarely accurate, despite the credits given to expert advisors on the TV program episode or movie. You can pinpoint certain good and bad practices

that students can critique. Can students differentiate those practices in professions such as law, medicine, nursing, and law enforcement from media depictions of those practices? Examples might include courtroom protocol, lawyer behavior, and ethics (*Boston Legal*, *Shark*, *L.A. Law*, *Law & Order*, and *A Few Good Men*); medical and nursing practices (*House*, *ER*, *Grey's Anatomy*, and *Scrubs*); medical examiner practices (*CSI*; *NCIS*; *Quincy, M.E.*; *Crossing Jordan*; and *Dr. G: Medical Examiner*); and police procedure and crime solving (*Law & Order*, *Cold Case*, *Cold Case Files*, *CSI*, *Third Watch*, *Hill Street Blues*, *NYPD Blue*, *Reno 911*, *Monk*, and *Mystery!*).

7. *Exaggerate a Particular Point*

There are a variety of strategies for exaggerating content, concepts, or examples. Hyperbole in movies and commercials can provide not only practical but unforgettable illustrations of particular points you want to convey. The visual images in a scene clip can rivet the attention of your students, especially when they have been prepared to search for the example. A few extreme examples of content in movie scenes include parody and ridicule (*The Producers* and *Monty Python and the Holy Grail*), FBI agent behavior and procedure (*Miss Congeniality*, *Breach*, and *Hannibal*), personality disorders (*A Beautiful Mind* and *Silence of the Lambs*), relationships across generations (*Meet the Parents*, *Little Miss Sunshine*, and *Spanglish*), personal coaching (*Hitch*), diplomacy and political decision making (*The West Wing* and *The American President*), and witness questioning (*A Few Good Men*).

8. *Snap Students to Attention*

While covering content on any particular topic, consider inserting one or more videos at strategic points to snap students to attention. Clips from comedies are most effective for this purpose. For example, if you are discussing how to deal with disappointment, say, "When you get fired from a job or rejected by the admissions committee of a university, it's like getting kicked in the stomach with the wind knocked out of you or getting hit in the head with a brick." Play the scene from *Home Alone 2* in which Kevin is on top of an apartment building throwing bricks at Marv down on the street but hitting Harry in the head over and over again. This scene is hilarious. It makes your point, grabs your students' attention, and lightens the serious topic a bit.

9. *Insert into Collaborative Learning Exercises*

Once you have used video clips as a regular teaching tool, require clips in relevant collaborative learning exercises, such as those in which students are assigned to give examples of practical applications. Either you can provide a list of possible clips from which each group can choose, or you can leave it open to the group with the requirement that you must screen their choice. Provide specific criteria on the purpose, execution, and outcomes of the exercise and how the clip should be integrated into the experience.

If appropriate and time permitting, you could schedule all or a few of these exercises to be performed in front of the whole class. A maximum time limit should be imposed. A ten-minute block is usually adequate. The class can then critique the performance and the concept, and the video clip can serve as the stimulus for discussion. This total class engagement and critical-thinking activity can be an unforgettable learning experience for everyone.

This collaborative learning activity matches the technology-savvy, kinesthetic, experiential, participatory, team-oriented characteristics of the Net Geners and their cultural world (Berk 2008a; Prensky 2006). Moreover, it draws on at least five of their multiple intelligences; their leadership, artistic, technical, and video gifts; and their learning styles. Plus, it fosters deep learning.

10. *Motivate and Inspire*

The pressure and stress students experience in their efforts to succeed in school, part-time jobs, standardized admissions exams, and life can be relieved—at least temporarily—by viewing a video clip with an uplifting message. The message may be related to the topic or not. You may be the only teacher to consider your students' mental health, and a short video clip may make a gigantic difference in their moods, motivation, and attitude. Here are some scenes and videos to review that may be just what the teacher ordered:

- a. Speech by Rocky Balboa to his son on dealing with rejection and failure (*Rocky Balboa*)
- b. Leaving a legacy (*Big Fish*)
- c. Following your dream (*The Pursuit of Happyness*)
- d. Motivational moments for writers to write (*Finding Forrester*, *Finding Neverland*, or *Freedom Writers*)

- e. Teaching (*Mr. Holland's Opus*, *Lean on Me*, *Dangerous Minds*, *Coach Carter*, or *Mona Lisa Smile*)
- f. John Nash, on the roof of a building at Princeton thinking about a thesis topic, says, "I need an original idea"; scene in the faculty club when he is told he will be receiving the Nobel Prize, as his colleagues come to his table one at a time to congratulate him and place their pens on the table (*A Beautiful Mind*)
- g. Team motivation in football (*We Are Marshall* and *The Replacements*), basketball (*Glory Road*), swimming (*Pride*), and ice hockey (*Miracle*)

Conclusions

This chapter was designed to acquaint you with the potential value and uses of video clips in the K–12 classroom. Video clips are a major resource for teaching the Net Generation and for drawing on their multiple intelligences and learning styles to increase the success of every student. There is a match between the media and students' intelligences (Gardner 2000; Veenema and Gardner 1996). The learning potential of the clips was expressed as twenty learning outcomes at the outset and ten specific techniques at the end. The material in between those anchors covered the theory and research on the brain and videos. The research on videos and multimedia learning provides an empirical foundation for their use in teaching—especially with introductory or basic material and low-achieving learners—to increase memory, comprehension, understanding, and deeper learning. It was also made clear that additional evidence needs to be collected in all grade levels and disciplines to support the various uses of video clips. Examples of research in several content areas were identified.

The technology requirements and the sources for selecting appropriate videos were also described. If you teach in one of the content areas in which there are clips and guidelines ready to use, and many of those clips are on your survey top forty, you're in great shape. You only have to decide how you want to use the clips and where and when to embed them. If you teach in other areas, start with the top forty and begin extracting the clips you want. Gradually, you will accumulate your own pool for use year after year. Draw on your creativity, imagination, and artistic gifts in applying these clips and those of your own choosing to your teaching; this will inevitably make the greatest difference in your classroom.

I challenge all teachers to incorporate video clips into their teaching and conduct classroom research on the effectiveness of the techniques they use.

The clips can add a dimension to teaching that may change how you teach forever; your view of teaching and your students will never be the same. In the years to come, maybe, just maybe, students will request DVDs of your classes to download onto their iPhones and PCs. Then they'll be able to play and relive those magical teaching moments.

Since the content of the October 2008 presentation focused on using videos in the classrooms of the future, this chapter will not be able to capture the flavor and spirit of the actual videos shown. The audience exhibited a range of emotions, from laughter to weeping to laughter to weeping. Unfortunately, this print version will probably only bring about the weeping. Learning Outcomes What is the learning value of video clips in the classroom? Here are twenty potential outcomes to ponder: 1. Grab students' attention. TV, Movies, and YouTube in the Classroom. Brain wave frequencies. Another aspect of brain functioning is brain wave frequencies. Table of Contents. Why Videos in the ESL Classroom? Types of Video. Why Videos in the ESL Classroom? Extensive research shows that video is a really effective tool for learning, particularly for English language learners. No matter the age of your students, it's highly likely they will respond well to the combination of visual and audio stimuli. Here are just some of the benefits of using video: It's fun and can help make a lesson more memorable. It's great for visual learners or students who have not yet learned to read and write well. Have your Say about Videos in the ESL Classroom? Rebhorn (1987) also uses Hollywood movies to enliven and enrich history classes, with the conviction that film brings an immediacy and interest to historical events that students often consider dull because they occurred long ago and faraway. Some of the films which she uses are "Inherit the Wind," "The Grapes of Wrath," "All the President's Men," and "Reds." Another example of more focused use of film and television in the classroom is found in a course on the Holocaust (Michalczyk, 1982). He believes that the structure and content of news presentations mirrors the practice of essay writing, and thus can serve as a writing project that effectively serves instruction. Abe, P., & Jordan, N. A. (2013). Integrating social media into the classroom curriculum. *About Campus*, 18(1), 16-20. Social media is an area that educators are often weary of tapping into as a resource to facilitate learning. This article examines the importance and implications of using social media in the classroom. Whilst it mostly focusses on social media in higher education, it is also applicable in a secondary school setting, particular in the senior years. With students that have been raised with the internet, smart phones and other technological devices, it is important to integrat...
