The Sands of Time Cannot be Stilled

If you work in an FDA-regulated industry, you are aware that FDA is celebrating its 100th anniversary this year. If you do not work in the industry, you are nonetheless aware that many aspects of your life—foods, both fresh and processed, drugs, including raw materials, ingredients, testing, laboratory processes, clinical testing, and many behind-the-scenes elements that go into each component—have been, and continue to be, touched by the FDA.

Like so many of our institutions and laws, the FDA was established in reaction to the outrage of United States citizens. In the FDA’s case, this outrage was elicited by Sinclair Lewis’s now classic, fact-based novel, *The Jungle*, which detailed the butchering and handling practices of the nation’s meat packers. This book, and other journalistic efforts, brought much needed attention to substandard treatment stemming from the callous disregard of safety and quality and the blatant greed of meat-packing company owners.

Over the last one hundred years, what the FDA grapples with has broadened as technology and science has expanded. At the celebration of the FDA’s Centennial Anniversary in Chicago on May 31, Associate Commissioner of Regulatory Affairs, Margaret O’K Glavin reminded us that more highly processed foods are being imported, more fresh foods are being imported, and more raw materials to make our drugs are being imported, than ever before. For example, as a result of the 9-11 terrorist attacks, Prior Notice Provisions must be granted by the FDA and are required by law for incoming food and drug stuffs. Since the law went into effect in 2002, 167,000 Prior Notice Provisions have been issued to safeguard our food supply—weekly.

At that same celebration, Janet Woodcock, MD, Deputy FDA Commissioner for Operations, indicated that the duties and responsibilities of the FDA have expanded exponentially, reflecting the technology and science of our time, and yet FDA resources, both financial and human, are limited. Because of this, over the last fifteen years or so, the FDA has been implementing a number of changes in the way it does business, for example, relying on third-party inspections, academia, and industry in many new ways. Among these changes, it has implemented process analytical technologies (PAT): the reliance on good science to eliminate inconsistencies that affect quality in manufacturing processes.

That brings us to the article on process analytical technologies written by John Helfrich, and submitted here by the Institute of Validation Technology. We hope the author’s clarity on this topic will bring insight to help you employ this FDA initiative in your work area, and make you just a bit more curious about our journals and our many other excellent authors, speakers, and products.

With best regards,
The Institute of Validation Technology

The novel follows the adventures of four women who are forced to leave their Spanish convent for the outside world of threat, violence and passions; and two men who are pitted against each other in a fight to the death. In Pamplona, Spain in 1976, the Basque people are fighting against the Spanish government for their rights to autonomy. ETA leader Jaime Miro, along with friends Ricardo Mellado and Felix Carpio, escape from prison, but PC SSE - DiscussionIs Sands of Time doomed to inevitably crash? (self.skyrimmods). submitted 1 year ago by Knight_Rhoden. I ask because I can play it on a completely unmodded game and it still crashes/fails to load saves after a few hours of play sometimes. Is this crashing inevitable for script-heavy mods like SoT? If not then what can be done to stop these crashes? USSEP? SSE Engine Fixes? I've got both but the unreliable nature of Sands of Time still can't be cured. 2 comments. share.
